

At the Forefront of High Energy Laser Technology since 1975

Since its founding over 40 years ago, Continuum has developed a full line of standard and custom high energy solid state lasers that are now used in scientific, industrial and commercial applications. These applications range from spectroscopy, materials analysis and Particle Image Velocimetry to x-ray generation and high energy plasma physics. With the recent expanded capability, Continuum now offers high peak power femtosecond lasers such as ultra-intense high contrast laser systems and high power CEP-stabilized sub-20 fs lasers.

Headquartered in San Jose, CA, Continuum manufactures and markets its complete family of laser products worldwide through a combination of direct sales offices in the US, Europe, and Asia, plus a talented team of distributors. Together, we support our products with local knowledge and a team-based service approach.

Throughout its 40 years, Continuum has remained committed to serving its core customer base with new products and capabilities, the most recent of which is expansion into DPSS and ultrafast markets.

Under the new ownership of the Amplitude Laser Group, we are looking forward to further strengthening our ultrahigh energy laser competencies, as well as positioning ourselves for advancements and expansive growth in core markets.
